                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 57,

The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compounds for inhibiting focal adhesion kinase expression, especially useful for inhibiting retinal neovascularization, or for diagnosing and treating e.g. colon cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PEBP2 alpha A gene expression regulating DNA PCR primer SEQ ID NO:26.
                                                                                                                                                                                                                                                                                              Human; focal adhesion kinase; FAK; signal transduction; cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                                                                                                                                              ö
                                    The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the

A new method for developing vaccines has been identified, in which a non-naturally occurring molecular scaffold, having a core particle and a covalently attached organiser, is attached to an antigen or antigenic determinant. The scaffold and antigen or antigenic determinant interact to form an ordered and repetitive antigen array. The composition is useful as a vacche against infectious diseases, to induce immune responses in farm animals and also in the treatment of cancer and allergies. The present sequence is the PCR primer, gpl40CysEcoRI. This primer was used to amplify the coding sequence for the gpl40 gene of human immunodeficiency virus (HVV). The PCR product was then used as an antigen in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes DNA which participates in the regulation of expression of PEBP2 alpha A gene. The DNA produces a regulator protein with the activity of promoting bone formation and can serve as a promoter for prevention and treatment of bone diseases including osteoporosis. The present sequence represents a PCR primer used in an example from the present invention.

of ligands to thrombin. These sequences were isolated using the single stranded DNA molecules given in AATO0201 and AAT00226 which comprise a 30N and a 60N variable region, respectively. These ligands were isolated using systematic evolution of ligands by exponential enrichment (SELEX). The selection was conducted in a buffer solution at 37 deg. C. After 12 rounds of selection, no additional improvement in binding was seen. By studying regions of homology between the isolated ligands, a retains high affinity binding and inhibits clotting. These ligands are inhibitors of thrombin and are therefore useful in treating thrombin mediated conditions and in studying the structure and binding of
                                                                                                                                                                                                                                                                                                                                ;

sequences given in AAT00202-25 and AAT00227-57 represent two groups
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a purified and isolated non-naturally occurring DNA ligands to basic flibroblast growth factor (bFGF). The ligands are useful as part of gene therapy treatments and for diagnosing pathogenesis of vascular diseases including intitation and progression of atherosclerosis, acute coronary syndromes, vein graft disease and restrenosis following coronary angloplasty. The ligands have improved stability in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel nucleic acid ligands to basic fibroblast growth factor that are useful as inhibitors of basic fibroblast growth factors and 2'-amino modified RNA ligands, exhibit increased in vivo stability

The method comprises adding a calibrator nucleotide to the sample, the exception of one or more regions which in the target hybridize with a probe labeled with a reporter and quencher, or which hybridize with the probe and with 2 or more primers. These regions have a different, randomized nucleotide sequence and a similar Then afferent, randomized nucleotide sequence and a similar Then brobes and primers are then added to the extracted sample, calibrator and target nucleotides from the sample. Probes and primers are then added to the extracted sample/calibrator nucleic acid specific probe permits quantitation of the copy number. Of the extracted target nucleic acid. The reaction in the presence of the target nucleic acid. The reaction in the presence of the calibrator nucleotide permits quantitation of the calibrator copy the total number of target templates and calibrator; allowing calculation of the percentage of calibrator recovery. The method may be used for the diagnosis of viral and any other pathogenic agents in body fluids, and to monitor safety and/or genetic composition of the extens, foods, and plant species used in the alimentary field. The waters, foods, and plant species used in the alimentary field. The method is used to quantitatively detect the genomic nucleic acid of human herpes virus (HHV)-6, HHV-7, HHV-8 and human immunodeficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Quantitative detection of nucleic acids, based on the use of a calibrator, suitable primers and probes, and a nucleic acid polymerase with 5' \cdot 3' nuclease activity

AAA78631 to AAA79262 represent sequence tags of human genomic DNA fragments containing polymorphic sites. The base occupying the polymorphic site is indicated using IUPAC-IUB nomenclature.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; genomic DNA; polymorphism; genome; allele-specific; primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a number of phosphorothicate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the

The present sequence represents a fragment from a clone of a method for including the 3'-untranslated region of a DNA molecule comprising KIAAO111. specification describes a method for removing the 3'-untranslated region of a DNA molecule comprises providing an open reading frame (ORF). The method comprises providing a DNA molecule having an ORF and a 3'-untranslated region, the DNA having a 5' overhang and a blunt end at the 3' end, and treating the DNA molecule with a 3'-5' exonuclease followed by a single-stranded used to produce RNA-protein fusion libraries. The fusion libraries can be used for the identification of protein-protein interactions, identification of drug targets, and hybridisation to solid supports to erreate protein chips (or beads). The RNA-protein molecules may be arranged in spatially defined arrays on the protein chips to carry out large scale screening for protein or compound identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Producing nucleic acids lacking 3'-untranslated regions to optimise production of fusion proteins, used to produce fusion libraries for identification of protein:protein interactions and drug targets for the production of protein chip:
                                                                                                                                                                                                            a
"an unspecified number of bases are present
between these nucleotides"
Nucleotide sequence of a clone from a RNA-protein fusion library.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a fragment from a clone of a mak-protein fusion library comprising KIAA0111. specification describes a method for removing the 3'-untranslated region of a DNA molecule comprising an open reading frame (ORF). The method comprises providing a DNA molecule having an ORF and a 3'-untranslated region, the DNA having a 5' overhang and a blunt end at the 3' end, and treating the DNA molecule with a 3'-5' exonuclease followed by a single-stranded nuclease to remove the 3'-untranslated region. The products can be used for the identification of protein-protein interactions, identification of drug targets, and hybridisation to solid supports to create protein chips (or beads). The RNA-protein molecules may be arranged in spatially defined arrays on the protein chips to carry out
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Producing nucleic acids lacking 3'-untranslated regions to optimise production of fusion proteins, used to produce fusion libraries for identification of protein:protein interactions and drug targets for the production of protein chips.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                     a "an unspecified number of bases are present between these nucleotides"
                                                                                         Nucleotide sequence of a clone from a RNA-protein fusion library
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The present invention relates to the use of apoptotic genes in the the production of transgenic plants with improved resistance characteristics. The present sequence is the mutagenic PCR primer Bcl2-3. This primer was used with primer Bcl2-5 (AAA48984) to introduce a 5' Nco1 site and a 3' Xbar site in the human apoptotic gene bcl-2. Specifically the primer introduced an Ala residue between the Met (position 1) and His (position 2) residues of the native protein. The altered bcl-2 sequence was used in the creation of the final vector used to transform plants. The improved resistance characteristics of the plants helps protect against bacterial, viral and other pathogens. Resistance to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                N-terminal transport polypeptide; insect pest control; cell cycle; Autographa californica multinucleocapsid nuclear polyhedrosis virus; AcMNPV; occlusion derived virus; ODV; 66 kD envelope protein; ODV-866; membrane protein; intranuclear viral-induced microvesicle; GFP; URF-13; beta-galactosidase; b-gal; green fluorescent protein; marker; primer; polymerase chain reaction; PCR; amplify; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The 5' nucleotide of the primer corresponds to nucleotide 21394 of the complementary strand of the maize plastid genome sequence. The primer was designed to add a Xhol restriction site downstream of an amplified rpoB fragment following PCR amplification. The PCR product was cloned into vector pBSKS+ and used to generate protecting RNA for use in in vitro capping experiments. The invention provides isolated rpoB, atpB, clpP and 16S rDNA NEP and PEP promoter elements (see AAV99569-99) useful for producing exogenous proteins of interest in plant plastids.
                                                                                                                                                                                                                                                                                                                                                                                       Isolated nuclear-encoded plastid RNA polymerase promoter sequences useful for expressing exogenous protein in plant plastids such as chloroplasts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mutagenic PCR primer Bcl2-3 targeted to anti-apoptotic gene bcl-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This is the nucleotide sequence of maize rpoB gene primer rpoB#3.

The sequences given in AAT59548-49 are primers which were used to amplify the sequence encoding residues 1-23 of Autographa californica multi- nucleacopsia nuclear polyhedrosls virus (ACMNPV) occlusion derived virus (ODV) 66 kD envelope protein (ODV-E66). ODV-E66 is an integral membrane protein of the ODV envelope. In an infected cell nuclear, ODV-E66 is present in the intranuclear viral-induced microvesicles and ODV envelope, providing evidence that the microvesicles microvesicles in mimediate precursor in the assembly of the ODV envelope. In infected cells, ODV-E66 localises to the ODV envelope. The ambranes of the nuclear envelope and cytoplasmic membranes in close juxtaposition to the nuclear envelope. The amplified sequence encodes the N-terminal, target sequence domain of ODV-E66. The target sequence may be used to target beta galactosiaase (b-gal), green cluorescent protein (GFP) and URF-13 to the membranes of the nuclear envelope which are further transported into the intranuclear correction envelope. The target protein for one of proteins to the ODV envelope and intranuclear microvesicles. It can be used for insect pest control, for therapeutic applications, e.g. correction proteins to the ODV envelope and intranuclear microvesicles. Correction proteins to the ODV envelope and intranuclear microvesicles. Correction proteins to the ODV envelope and intranuclear microvesicles. The correction proteins to the oDV envelope and intranuclear microvesicles. Correction proteins to the oDV envelope and intranuclear microvesicles. Correction proteins to the oDV envelope and intranuclear microvesicles. The membrane which will alter the cell cycle and for diagnostics, e.g. to insert a marker specific for a disease or abnormality into a cell tissue correction manifesting such abnormalities.

                          The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Quantitative detection of nucleic acids, based on the use of a calibrator, suitable primers and probes, and a nucleic acid polymerase with 5'-3' nuclease activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        sample which uses a calibrator, suitable primers and probes, and a nucleic acid polymerase with 5-3' nuclease activity is described. The method comprises adding a calibrator nucleotide to the sample, the calibrator nucleotide having the same sequence as the target with the calibrator nucleotide having the same sequence as the target with a probe labeled with a reporter and quencher, or which hybridize with a probe and with 2 or more primers. These regions have a different, randomized nucleotide sequence and a similar Tm. Then extracting the calibrator and target nucleotides from the sample. Probes and primers are then added to the extracted sample/calibrator
                                                                     in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detection; identification; PCR; polymerase chain reaction; probe; primer; callbrator; diagnosis; pathogen; virus; bacteria; HHV-6; HHW-7; HHV-8; human herpes virus; human immunodeficiency virus; HIV; AIDS; acquired immune deficiency syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   mixture and PCR is performed. Reaction in the presence of the target nucleic acid specific probe permits quantitation of the copy number

This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
calculation of the percentage of calibrator recovery. The method may be used for the diagnosis of viral and any other pathogenic agents in body fluids, and to monitor safety and/or genetic composition of waters, foods, and plant species used in the alimentary field. The method is used to quantitatively detect the genomic nucleic acid of human herpes virus (HHV)-6, HHV-7, HHV-8 and human immunodeficiency virus (HIV). The method provides an enhanced sensitivity, accuracy, and precision and a reduced measure viability. For specific probe, primer and calibrator sequences used in the method, see GENESEQ records AA23935-293965.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense compounds for inhibiting focal adhesion kinase expression, especially useful for inhibiting retinal neovascularization, or for diagnosing and treating e.g. colon cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; focal adhesion kinase; FAK; signal transduction; cancer; embryonic development disorder; angiogenic disorder; wound healing; antisense; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The sequences given in AAQ50202-70 are oligonucleotides which were used to illustrate the method of the invention for the mutagenesis of inhibitory/instability signals (INS). Mutation in an INS produced using oligonucelotides such as these, increases the stability and/or utilisation of mRNA without changing its protech coding capacity, or if the sequence is changed, its function is maintained. Other genes encoding such mRNA molecules include growth factor, interferon,

This oligonucleotide Fas1 is used for the generation of a Fas signal sequence for post translational modification of a novel human Fas ligand (hFasL) fusion protein. This novel protein comprises of hFasL or a truncated or functionally equivalent variant that retains the Fas truncated to Incorporate inducing properties of hFasL. This is liked to Glycosyl-Phosphatidyl inositol (GFI) at its C-terminus. DNA encoding hFasL amino acids, a linker sequence and a human Fas signal sequence derived from human CDIG. The fusion protein can be produced by culturing COS cells transformed by the expression vector product. This novel fusion protein can incorporate its lipid tail can be produced. This novel fusion protein can incorporate its lipid tail can be protein on the cell surface. This can bind to Fas receptor present on other cells, particularly T lymphocytes, and thereby induce their apoptosis. This is useful for preventing or treating tissue or organ allograft or xenograft rejection. This provides a specific treatment for activated T lymphocytes, i.e. only for T lymphocytes that expresses the Fas antigen, which attack the transplanted tissue or organ.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1-2-rhamnosyl-transferase; hesperidin conversion; orange peel; NHDC; flavone-7-0-glucosidase-2"-0-rhamnosyl-transferase; flavanoid glycoside; sweetener; neohesperidin dihydrochalcone; grapefruit; pomelo;
                                                                                                       Human Fas Ligand fused to carboxy-terminal glycophospholipid - useful for preventing or treating tissue or organ allograft or xenograft rejection

It is used with AAQ28273 to amplify human endothelial cDNA producting 251 and 420 bp products. Sequencing of the 251bp product revealed a novel sequence containing both primers but with little homology to known tyrosine kinases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting polymorphism associated with cancer pre:disposition - also DNA, vectors and host cells e.g. for gene or protein replacement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         An individual can be diagnosed as having a predisposition to cancer by detecting an alteration in the wild type multiple tumour suppressor (MTS) gene, using gene probes which hybridise to the MTSIElbeta gene OFF (amplified using the PCR primers AAT00719-21). The above assay can also be used in the diagnosis and prognosis of melanoma, lymphoma, leukaemia and pancreas, breast and thyroid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Multiple tumour suppressor; MTS1Elbeta; cancer; diagnosis; assay;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The cDNA sequences encoding several multiple tumour suppressor (MTS) polypeptides have been isolated and sequenced, using various sequencing and amplification primers such as the primer represented in this sequence. MTS polypeptide-encoding cDNAs and mutants of these are useful for the diagnosis or prognosis of human cancer. Germ-line mutations of MTS cDNAs can be used for diagnosing predisposition to melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL and cancers of the pancreas, thyroid, ovary, uterus, testis, kidney, stomach and rectum. The wild-type gene is useful for gene therapy and MTS polypeptides may also be used for protein replacement therapy. Also the polypeptides or cells contg. an altered MTS gene are useful for screening for potential cancer therapeutics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Wild-type multiple tumour suppressor (MTS) gene and mutant sequences - useful in diagnosis, prognosis and therapy of human cancer, e.g. melanoma or leukaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Primers AAV11267-V11269 are used in the isolation of the human multiple tumour suppression protein, MTS1E1-beta. The MTS gene locus is also referred to as the familial melanoma (MLM) gene locus, located on human chromosome 9921. Germ line mutations in MTS genes can be used in the diagnosis of predisposition to cancers, e.g. melanoma, leukaemia, astrocytoma, gliboblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL, and cancers of the pancreas, breast, thyroid, ovary, uterus, testis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; multiple tumour suppressor 1 gene; MTS1; cancer; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                  This is the nucleotide sequence of a PCR primer used for amplification in the method of the invention involving the use of the multiple tumour suppressor (MTS) gene, to diagnose and treat cancer. The MTS gene is useful in the diagnosis and prognosis of human cancer, e.g. by standard nucleic hybridisation techniques, of patient samples. The mutated sequences are those that are present in somatic mutations of the gene in cancers. The vectors can be used for gene therapy strategies to replace function of mutated to protein in patients. These can also be used to construct protein mimetics, also for therapeutic strategies. In addition the expression constructs can also be used for recombinant production of MTS. Recombinant MTS can be used to screen for drugs to be used for cancer therapy, and the protein itself may also be used to restore MTS function in a cell.

PCR primers AAV70612-14 were used to amplify nucleic acid encoding a human multiple tumour suppressor 1E1-beta (MTS1E1-beta) protein. Primers designed from the gene can be used to design primers to detect anormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast, thyroid, pancreas, uterus and kidneys.
                                                                                                                                                                                                                                                                                                                                                                                            Example 11; Column 48; 80pp; English.

                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes new purified and isolated nucleic acids (i) encoding: (i) the A and B chains of a ricin-like toxin (II); and (ii) a heterologous linker, joining the two chains and including a cleavage recognition site for a disease-specific protease (III). Also described are: (I) plasmids or baculovirus transfer vectors that contain (I); and (2) recombinant protein (IV) consisting of the A and B chains of (III) joined by the specified linker. (IV), produced by expression of (I) in host cells, are used to inhibit or kill diseased cells that produce (III), particularly for treating cancers (e.g. leucocyte prodliferation; cancer of ovary, pancreas, breast or prostate; glioma) or infections caused by fungi, parasites (e.g. malaria) or viruses (e.g.
                     The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated
                                                           in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the
                                                                                                                                                                                         Gaps

cytomegalovirus (CMV), herpes, hepatitis, rhinovirus, laryngeotracheitis, poliomyelitis or varicella zoster), also cystic fibrosis and multiple sclerosis. Alternatively, (I) is used to express (IV) in vivo. (IV) is toxic specifically for (III)-expressing cells and does not depend for specificity on a cell-binding component. When used to treat virus-retrograde cells, transcytosis and cytotoxicity of (IV) are increased by retrograde translocation from endoplasmic reticulum to cytoplasm (which some viruses exploit to avoid immune detection), so selectivity and safety are further improved. (IV) are not toxic until chain A is released and this occurs only in target cells. The present sequence represents a nucleotide sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense compounds for inhibiting focal adhesion kinase expression, especially useful for inhibiting retinal neovascularization, or for diagnosing and treating e.g. colon cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; focal adhesion kinase; FAK; signal transduction; cancer; embryonic development disorder; angiogenic disorder; wound healing; antisense; phosphorothioate; ss.

Enhanced LM609 grafted antibodies exhibiting selective binding affinity to alpha(V)beta(3) integrin, useful in the diagnosis and treatment of angiogenesis, inflammatory diseases e.g. psoriasis, cancers and osteoporosis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to enhanced LM609 grafted antibodies exhibiting selective binding affinity to alphavbeta_3 integrin or their functional fragments. The antibodies or their functional fragments can be used in the diagnosis and treatment of arginated diseases such as anglogenesis, inflammatory diseases (such as psociasis and chronic articular rheumatism), disorders associated with inappropriate or inopportune invasion of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ss; Ml3mp18; sequencing; target specificity; PCR; amplification; differential primer extension.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAV49844-V49877 are nucleotide fragments of the grafted monoclonal antibody utaxin bind selectively to integrin alphabeta3 and can be used to inhibit binding of alphabeta3 to a ligand and thus block integrin-mediated signal transduction. This is useful in the treatment, prevention and diagnosis of alphabeta3 condisted disease, specifically angiogenesis and restenosis (but also e.g. (non-)immune inflammation, rheumatoid arthritis, macular degeneration, osteoprosis etc.). The antibodies contain non-murine framework regions so are suitable for use in humans. Enhanced types of IM609 have affinity more than 90 times
                                                                                                                                                                                                                                                                                                              Vitaxin; antibody; variable region; heavy chain; light chain; integrin; LM609; inhibitor; integrin-mediated signal transduction; treatment; diagnosis; angiogenesis; restenosis; inflammation; diabetic retinopathy; neovascular glaucoma; cancer; psoriasis; rheumatoid arthritis; murine; macular degeneration; osteoporosis; primer; V-L region; CDR; complementarity determining region; series

The invention provides polymorphic fragments of genes associated with hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of polymorphism in the disease, and this can be used to identify potential drugs which combat the disease. The polymorphisms can be tested for association with other disease e.g. agammaglobulinemia, diabetes inspidus, Lesch-Nyhan syndrome, muscullar dystrophy, wiskort-Aldrich syndrome, Fabrys disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrands disease, therefitery hemorrhagica telangiectasia, familial colonic polyposis, Ehers-Danlos syndrome, osteogenesis imperfecta, and acute intermittent porphyria. The polymorphic forms can also be used in formatic polyposis.
                                                                                                                                                                                                                                                                                                                                                                                         Novel nucleic acids containing polymorphisms used in the diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Marek's disease virus; MDV; vaccine; antisense; therapy; latency; tumor; primer; polymerase chain reaction; PCR; ss.
